1. Introduction and references.....	page 2
2. File locations and syntax descriptions.....	page 3
3. Excel (5.0 / 7.0) files descriptions.....	page 7
4. PRN ( <i>comma decimal point format</i> ) files descriptions.....	page 10
5. PRN ( <i>dot decimal point format</i> ) files descriptions.....	page 12
6. Data series code descriptions and station locations.....	page 14
7. Various data tables and charts.....	page 30

*Tables containing pressure data statistics:*

Sveinn Pálsson series.....	page 30
Rasmus Lievog series.....	page 31
von Scheel series.....	page 32
Magnús Ketilsson series.....	page 48

## **INTRODUCTION**

*Trausti Jónsson and Gísli Kristjánsson*

### *Instrumental observations in Iceland in the EIP A Data Companion*

The EU ENV-4 program ADVICE enabled the Icelandic Meteorological Office to resume work on the digitization of early instrumental observations in Iceland. This work had started on a small scale around 1990 with a grant from the Icelandic Science Fund. Now it was possible to search for more data and digitize much more. It also became possible to do more background work and finally to make the data available for the general community.

The present report is a companion to the data files and gives an introduction to the data format. Some checking is also included. For more information on the background, stations and observers one must refer to Hávarðsson (1997), Jónsson and Garðarsson (1998) and Thorbjarnardóttir et.al. (1998). Here a very short overview is sufficient (from the abstract of Jónsson and Garðarsson above).

When the Danish Meteorological Institute (DMI) was established in 1872 it took over the responsibility of meteorological observations in Iceland. Prior to that time, the observations were in the hands of interested individuals, in some cases in close contact with the international scientific community. The original data material has accumulated at the Manuscript section of the Icelandic National Library and at the Icelandic Meteorological Office. Much of it was delivered to Iceland along with other documents from official Danish archives after the formal independence of Iceland. The oldest such observations that have been found were made in 1749-1751 and 1763. The temporal density increases after 1775 and from 1822 there is at least one instrumental observation to be found on each and every day, somewhere in the country. During the 1776 to 1822 period there are many gaps, both short and long, the longest from late 1814 to mid-1820. During this last gap almost no instrumental records have been found. The quality of the observations is very variable, but generally they seem to be at least internally consistent and will certainly become an important addition to the knowledge of the climate and climatic variability of the Northeast Atlantic.

## - File locations and syntax descriptions -

### 1. Excel (5.0 / 7.0), Word (6.0 / 95), and PRN file locations:

- Raw data is stored on regular diskettes both in Excel and PRN files. The Excel files are stored on 5 diskettes named: *Advice Data #1 to #5*. Data PRN files (with a comma decimal point) are stored on 3 diskettes named: *Advice CPRN #1 to #3*. The 3 diskettes containing PRN files (with a dot decimal point) are named: *Advice DPRN #1 to #3*.
- Processed data is stored in Excel files on 3 regular diskettes. The names of these diskettes are *Advice Proc #1 to #3*.
- Notes and file descriptions are stored in Word files on a diskette named *Advice notes*. It contains 17 files of which 13 hold weather code descriptions, the name of the observer and weather station location in latitude and longitude for each of the 13 data series. For information on the remaining 4 files, see end of 2<sup>nd</sup> chapter.

NOTE: See **Table I**, at the end of this document, for an index of file locations.

### 2. File names – Syntax descriptions:

- Excel raw-data series files:

➤ The name format for 14 of these 17 files is: *dxxxxyyf.xls*. The first letter *d* indicates that the files contain raw data.

xx: The name initials of the observer in the order: first name initial, surname initial. An exception from the rule are the two files: *d1x1763.xls* and *d2x1776f.xls*. The reason is that the observers and exact locations of these 2 stations are not known.

yyyy: The year in which the observations started. If the observations continue into one or more new calendar years, then the 8<sup>th</sup> letter is *f*, otherwise no letter follows the year.

The excel-file 3 letter ending (*xls*) is off course preceded by a dot.

NOTE: If the files are to large to store on a single diskette, they are compressed into a ZIP archive. Every diskette that contains such an archive has a text file named: *read me.txt* containing help on extracting the files contained. If ZIP-extracting software is not available, we have included such a device on a separate diskette. It is called WinZip and is solely for the W95 platform.

➤ The 3 remaining raw data files are:

1. *dmkdiary.xls*: Magnús Ketilsson's weather diary.
2. *drltable.xls*: Weather tables compiled by Rasmus Lievog.
3. *dsptable.xls*: Weather tables compiled by Sveinn Pálsson.

- Excel processed-data files:

The name format for these 12 files is: *pxx<sub>+</sub>nnn.xls*. The first letter *p* indicates that the files hold processed data.

*xx*: the name initials of the observer in the order: first name initial, surname initial. They indicate from which series data is being processed.

The 4<sup>th</sup> index position in the name holds either the + (plus) or the \_ (underscore) symbol. The latter symbol (\_) indicates that the file only holds processed data from one series. The + symbol, on the other hand, indicates that the file holds processed data from more than one data series.

*nnn*: An index starting with 001.

Example: The name of the files: *psp+001.xls* and *psp+002* indicate that both the files hold processed data from more than one weather data series, of which one is the Sveinn Pálsson series.

- PRN files containing raw data:

The name format for these files is: *dxx\_comd.prn* or *dxx\_dotd.prn*. The first letter *d* indicates that the files hold processed data. The first name format is used for prn-files with a *comma (,) decimal point* format and the latter for a *dot (.) decimal point* format. A decision was made to include a double set of the PRN files with both these formats because not all software packages permit a comma decimal in numbers.

*xx*: The name initials of the observer in the order: first name initial, surname initial. An exception from the rule are the two files: *d1x\_comd.prn* (or *d1x\_dotd.prn*) and *d2x\_comd.prn* (or *d2x\_dotd.prn*). The reason is, as mentioned above, that the observers and exact locations of these 2 stations are not known.

- Word files containing descriptions and notes:

The name format for 13 of the 17 files on the diskette is: *xxnotes.doc*. The 1<sup>st</sup> and 2<sup>nd</sup> letters are the name initials of the observer in the order: first name initial, surname initial. They indicate that the descriptions are of data in the observers series.

A file named *excl\_not.doc* holds descriptions on all Excel files. It includes: File names, size (in kb.), file dates, location on diskette, file descriptions and source of data.

The files: *dprn\_not.doc* and *cprn\_not.doc* hold descriptions on PRN files with a dot decimal point and a comma decimal point format, respectively. The descriptions include: File names, size (in kb.), file dates, location on diskette, file descriptions and source of data.

The diskette also contains this word file, named: *file\_not.doc*.

## ***The Lievog series pressure adjustments.***

### **ppp(UC)**

Raw pressure data. The original French inches (27,07 mm.) have been converted to hPa. Dubious values as original.

### **ppp(EC)**

Here "obvious" errors have been adjusted in pressure.

### **ppp(C1)**

1. The pressure means for the Lievog series (period 1779-1785, 1789) was calculated and grouped by months. The same was done with the Southwest Iceland pressure series (Period: Jan. 1874 - Dec. 1976).
2. A 10<sup>th</sup> degree polynomial fit was calculated for each of the two 12 value series. The difference of the January value of the polynomial in #2 and the corresponding value in #1 was then calculated. A likewise calculation was made for every calendar month. The difference between these two fitted series was calculated. This resulted in a singular 12 value series with one adjustment value for each month. These values were then added to the ppp (EC) to adjust the pressure in the Lievog series.

**Note:** Some observations made in Reykjavík occasionally throughout the years until 1810, as Pálsson visited the town.

## ***The Sveinn Pálsson series pressure adjustments.***

### **ppp(UC)**

Raw pressure data. The original French inches (27,07 mm.) have been converted to hPa. Dubious values as original.

### **ppp(EC)**

Here "obvious" errors have been adjusted in pressure.

### **ppp(C1)**

Here the 1<sup>st</sup> pressure adjustment has been implemented. It was obtained after making two statistical observations.

1. The pressure difference between the von Scheel and the Sveinn Pálsson series in their mutual observation period was calculated by using the last common observation time each day (usually the evening observation). These resulting values were grouped by months.
2. The mean of monthly means each year was calculated (by months) for pressure in the Akureyri series and corresponding values in the south-west series during the period of Jan. 1874 – Des. 1996.

These two operations result in two 12 value series (one mean for each month). A 10<sup>th</sup> degree polynomial fit was calculated for each of the two series. The difference of the January value of the polynomial in #2 and the corresponding value in #1 was then calculated. A similar calculation was made for other calendar months. This resulted in a singular 12 value series with one adjustment value for each month. These values were then used to adjust the pressure in the Sveinn Pálsson series. This procedure is supported by an investigation of the pressure difference at different wind directions (see excel files: *psp+005.xls* and *psp+006.xls*).

### **ppp(C2)**

This is the result of 2<sup>nd</sup> pressure adjustment. Three hPa were added to the pressure values from the 1<sup>st</sup> adjustment [ppp(C1)]. This adjustment sets the average of the whole series approximately equal to the annual average during the period 1961 – 1990.

❖ ❖ ❖

## ***The von Scheel series pressure adjustments.***

### **ppp(UC)**

Raw pressure data. The original French inches (27.07 mm.) have been converted to hPa.

### **ppp(C1)**

1. The instrument temperature is not available but has been estimated. The instrument was located in an unheated room. The relationship between the ambient temperature at the barometer ( $t_{tt_b}$ ) and outside temperature ( $t_{tt_o}$ ) is here based on comparative measurements at Nes near Reykjavík made in 1822-1829.

$$t_{tt_b} = 0,813 * t_{tt_o} + 2,309$$

It is assumed that in the case of very low outside temperatures ( $t_{tt_o} < -6,5 \text{ } ^\circ\text{C}$ ), the inside temperature will not fall below  $-3 \text{ } ^\circ\text{C}$ .

The Celsius freezing point is used as reference for the adjustment which is  $0,16917 \text{ mb/}^\circ\text{C}$ .

Because mercury expands as temperature increases the adjustment is negative at temperatures above freezing point (Celsius) and positive below zero.

2. An adjustment was made for height above sea level (+0,6 hPa) and gravity (+1,5 hPa).

### **ppp(C2)**

5 hPa index adjustment has been added to the ppp(C1) series.

Jón Thorsteinsson 1820 – 1854

Jónas Jónasson 1857 – 1859

### Day - to - day pressure difference at Reykjavík (modern)

(Winter half-year)

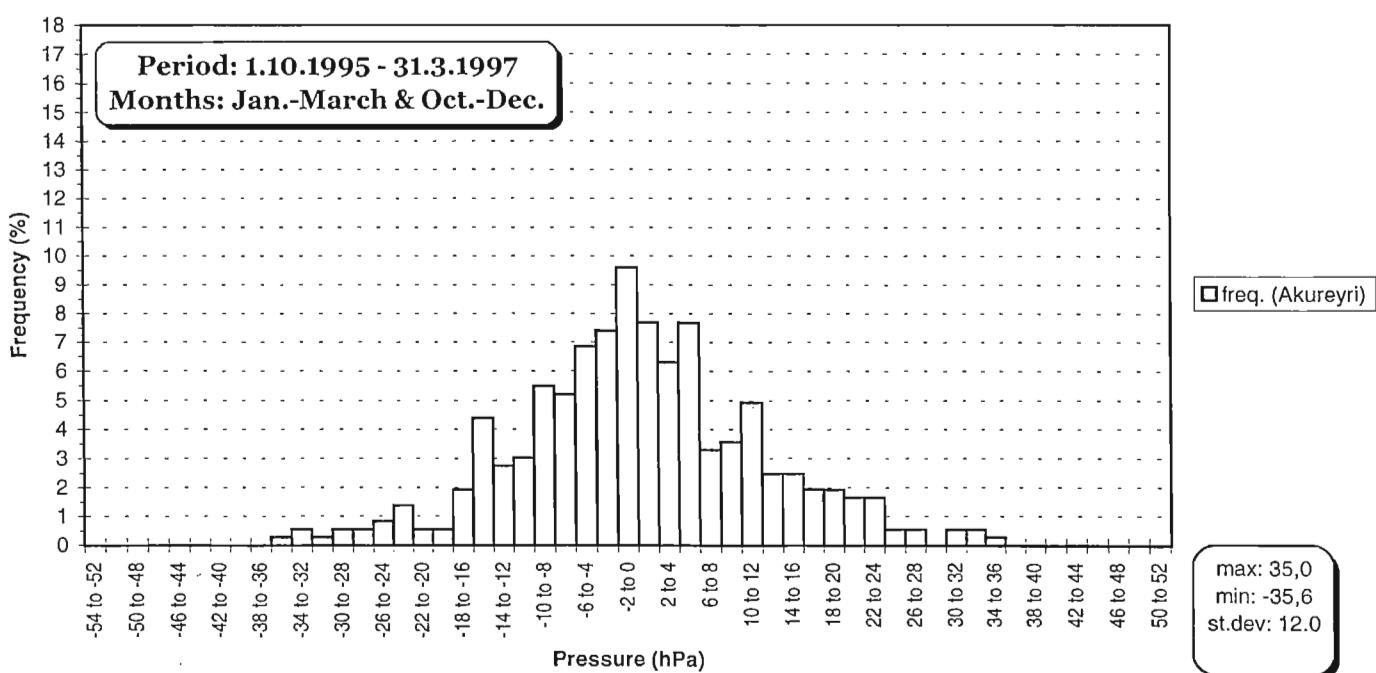

### Day - to - day pressure difference at Akureyri (v.Scheel series)

(Winter half-year)

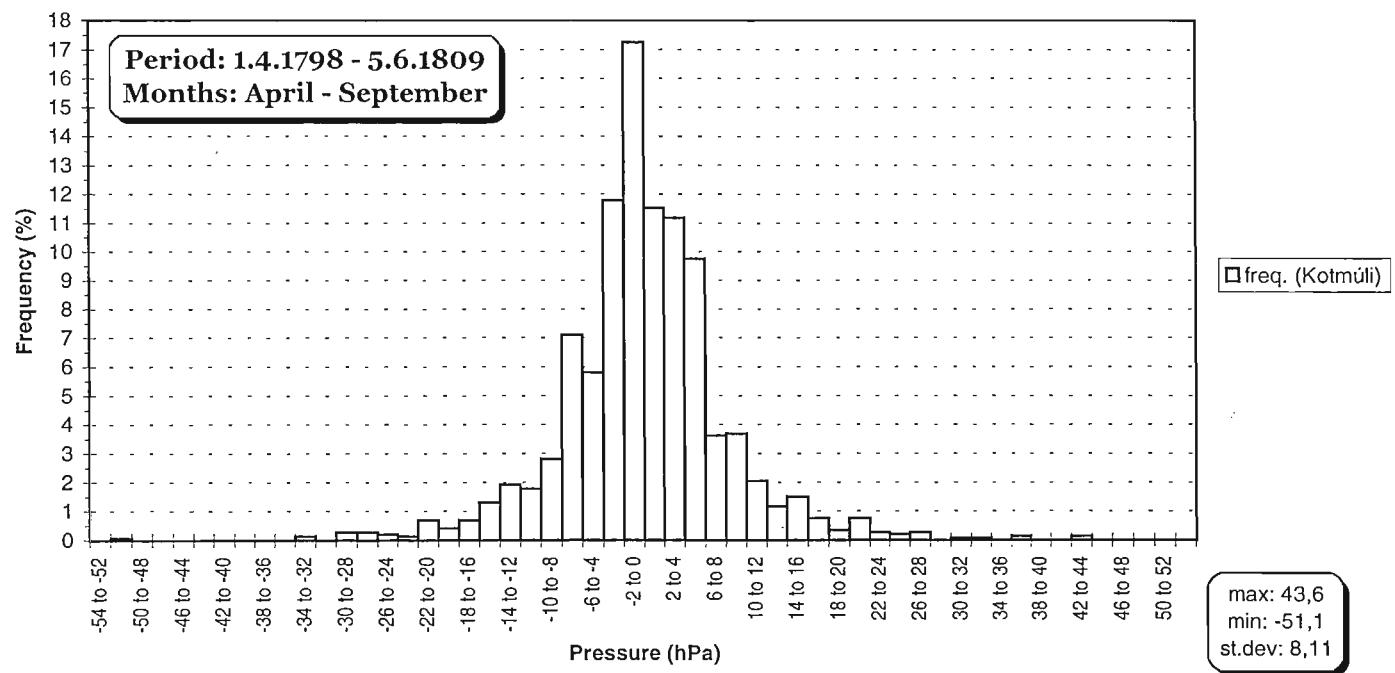

### Day - to - day pressure difference at Akureyri (modern)

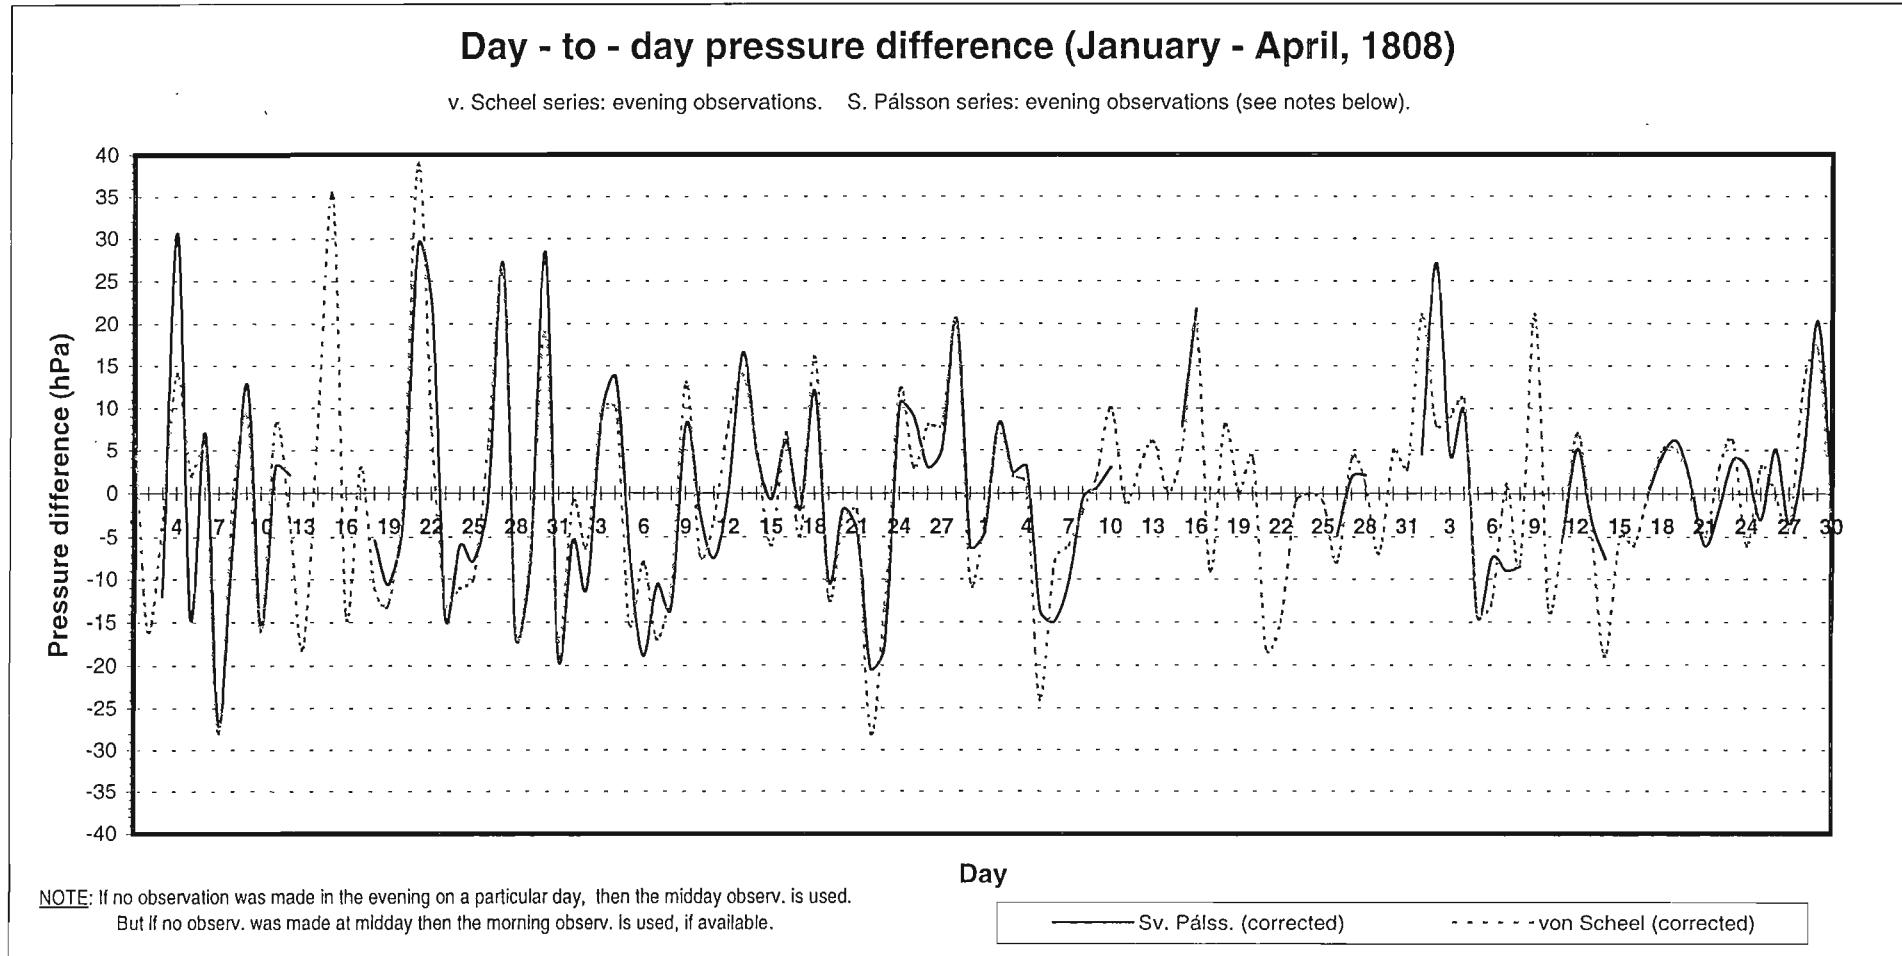

(Winter half-year)

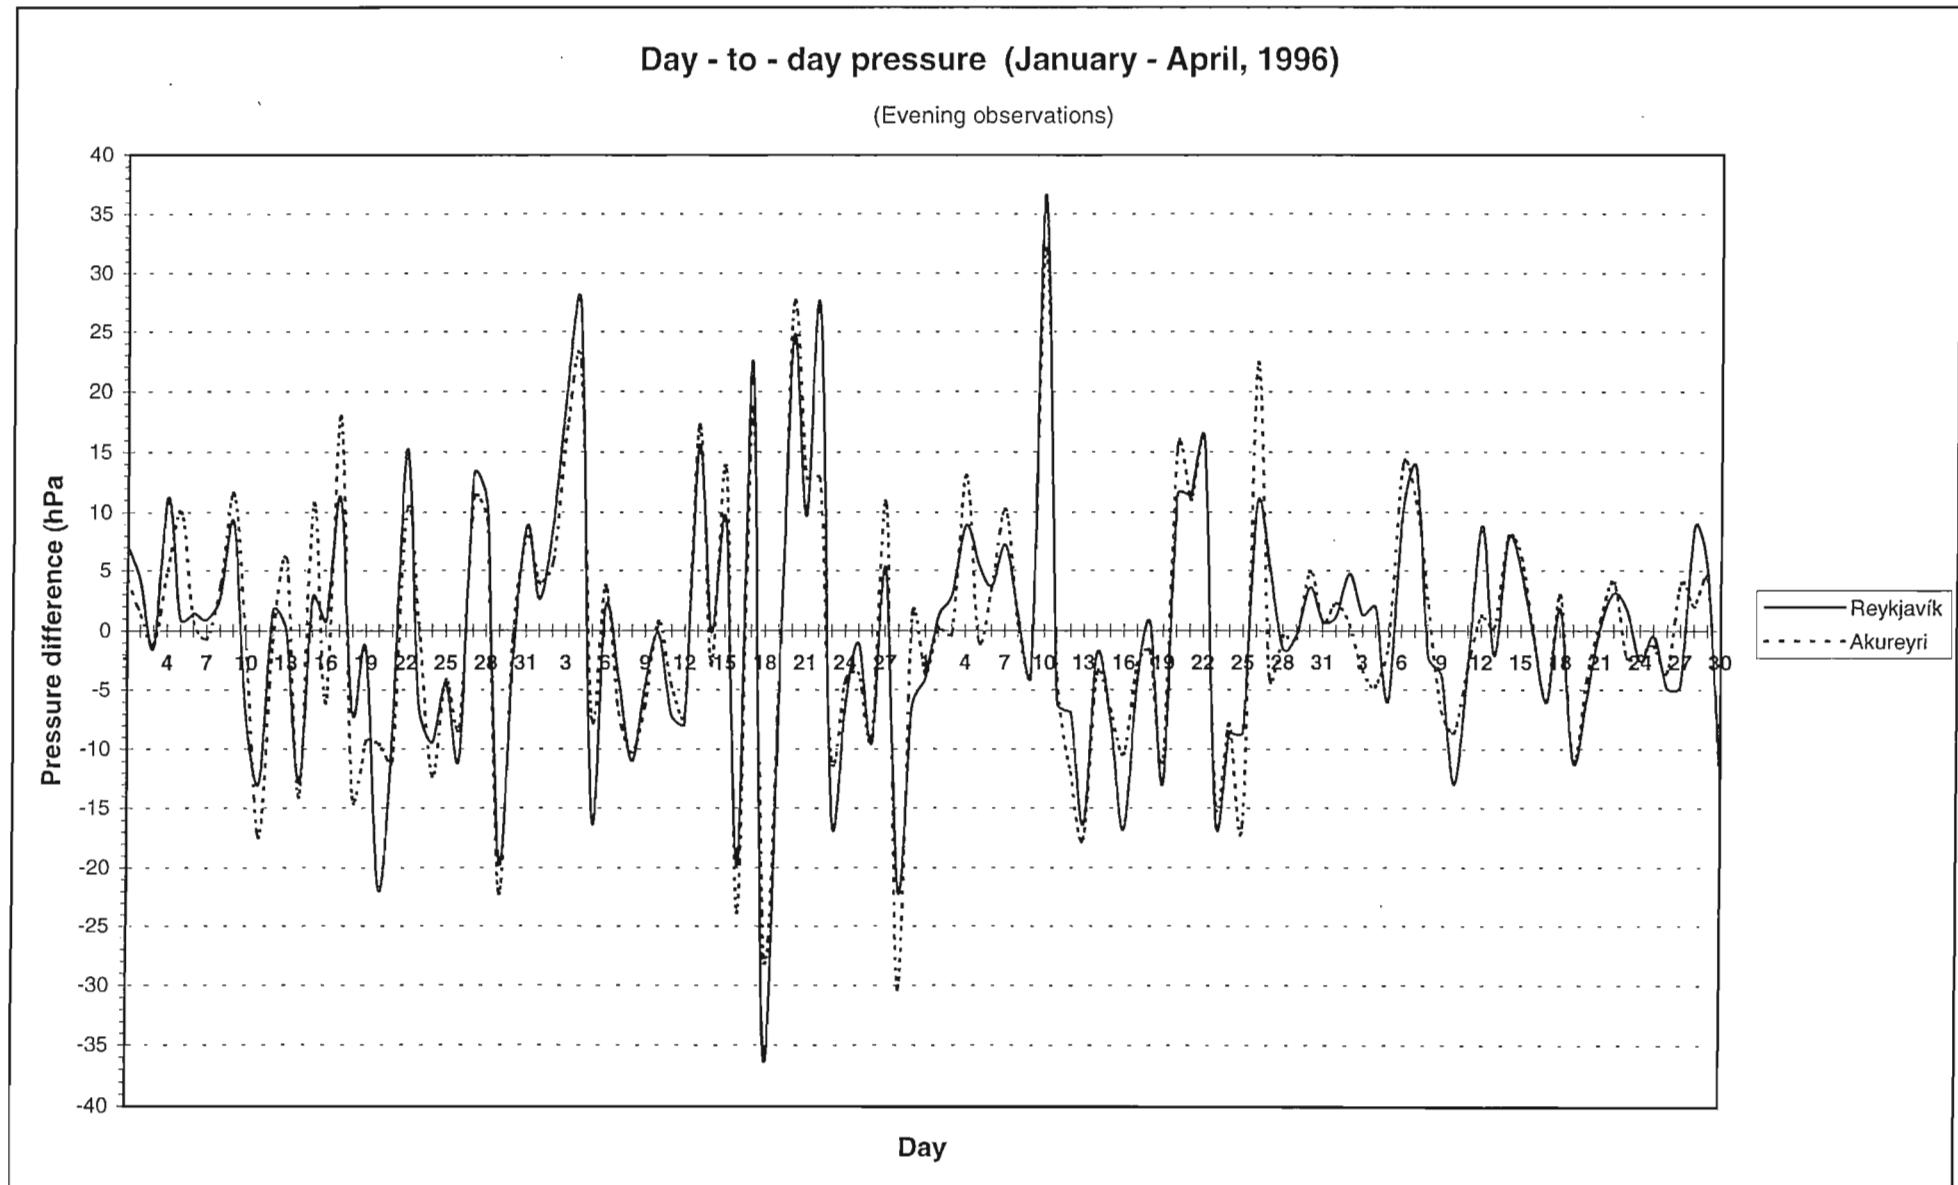

### Day - to - day pressure difference at Kotmúli (Sveinn Pálsson ser.)

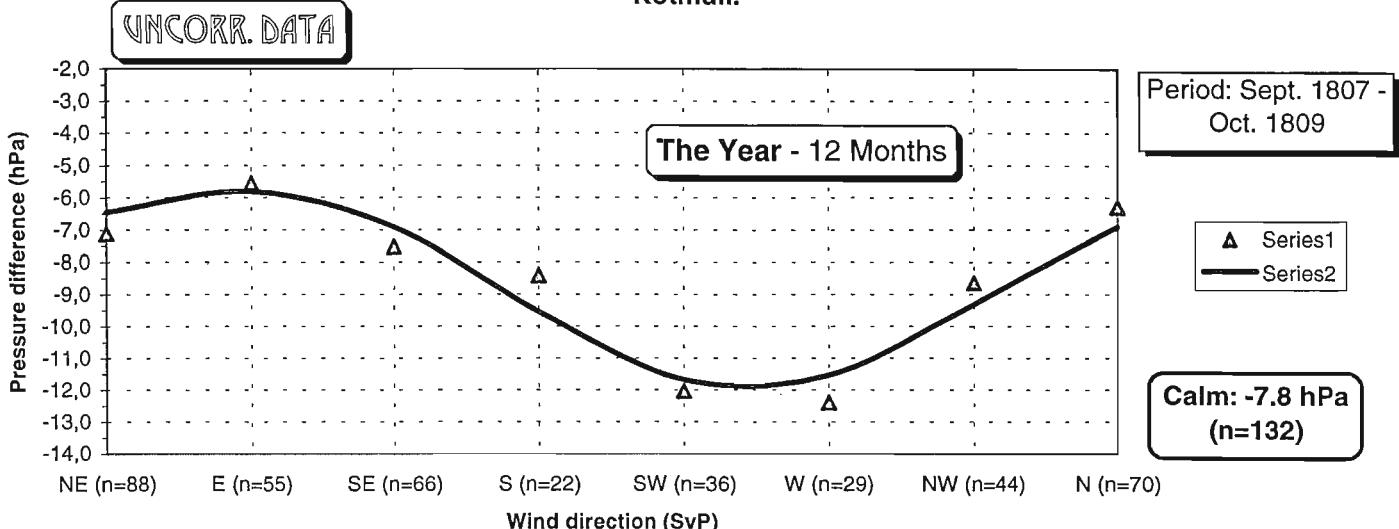

(Summer half-year)

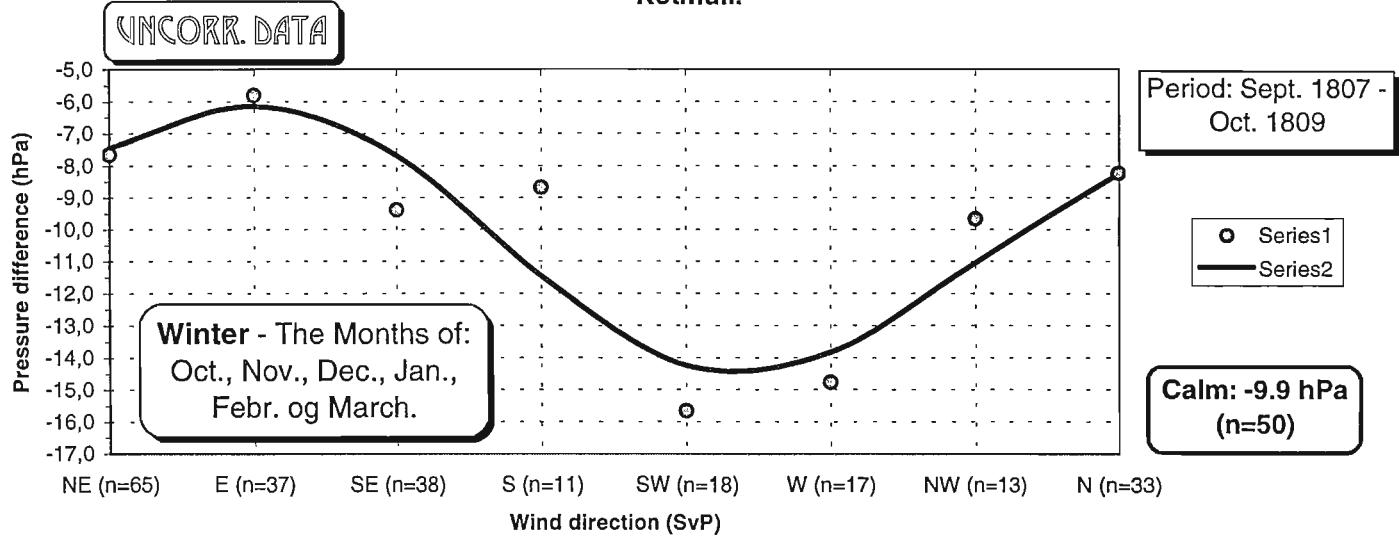

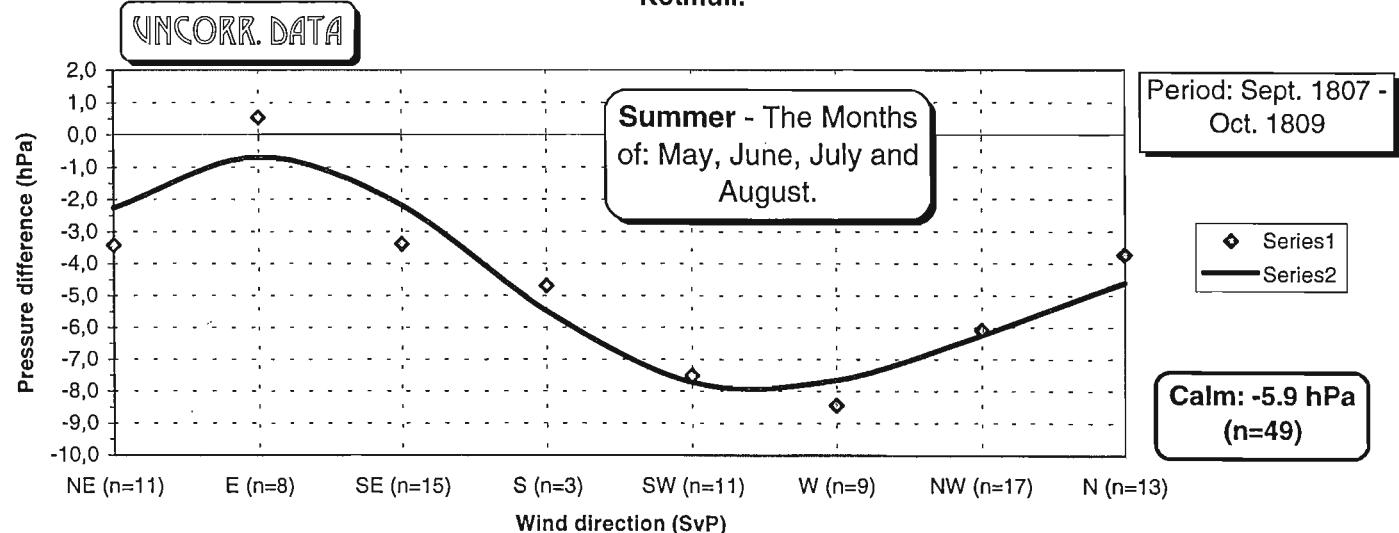

Average pressure difference (V.Sch - SvP) grouped by wind direction observations at Kotmúli.

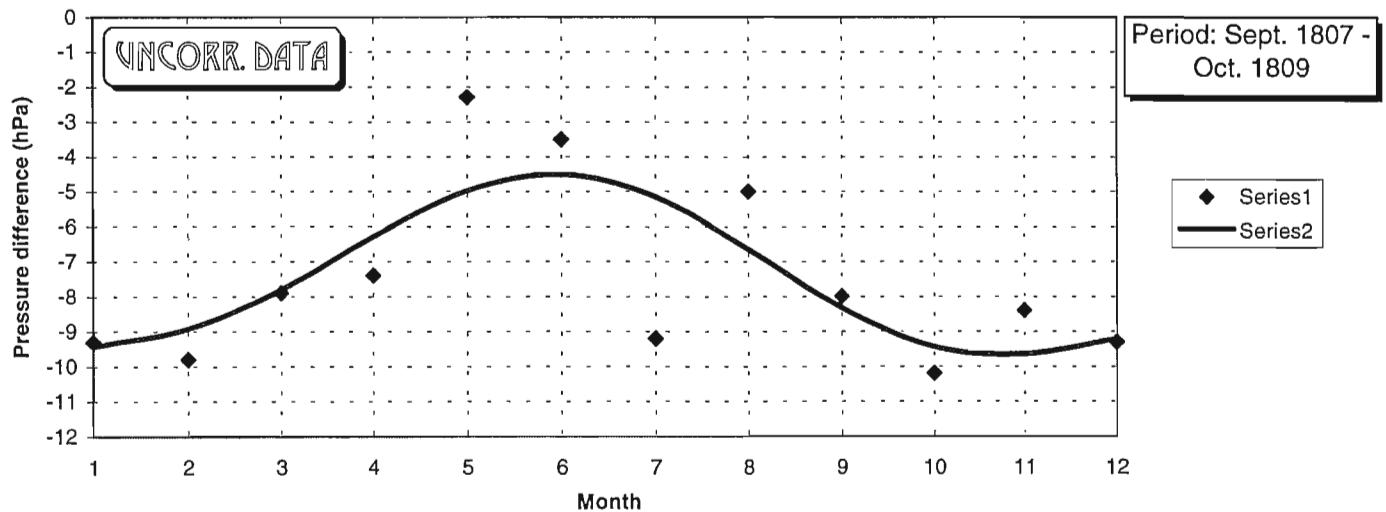

Average pressure difference (V.Sch - SvP) grouped by wind direction observations at Kotmúli.

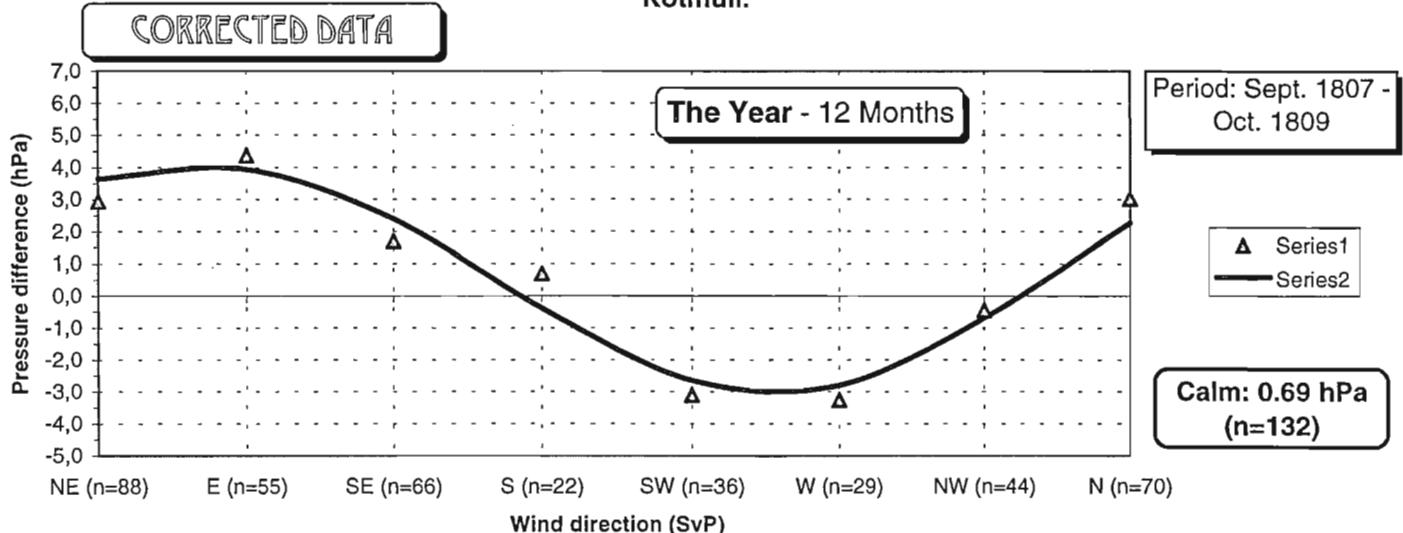

Average pressure difference (V.Sch - SvP) grouped by wind direction observations at Kotmúli.

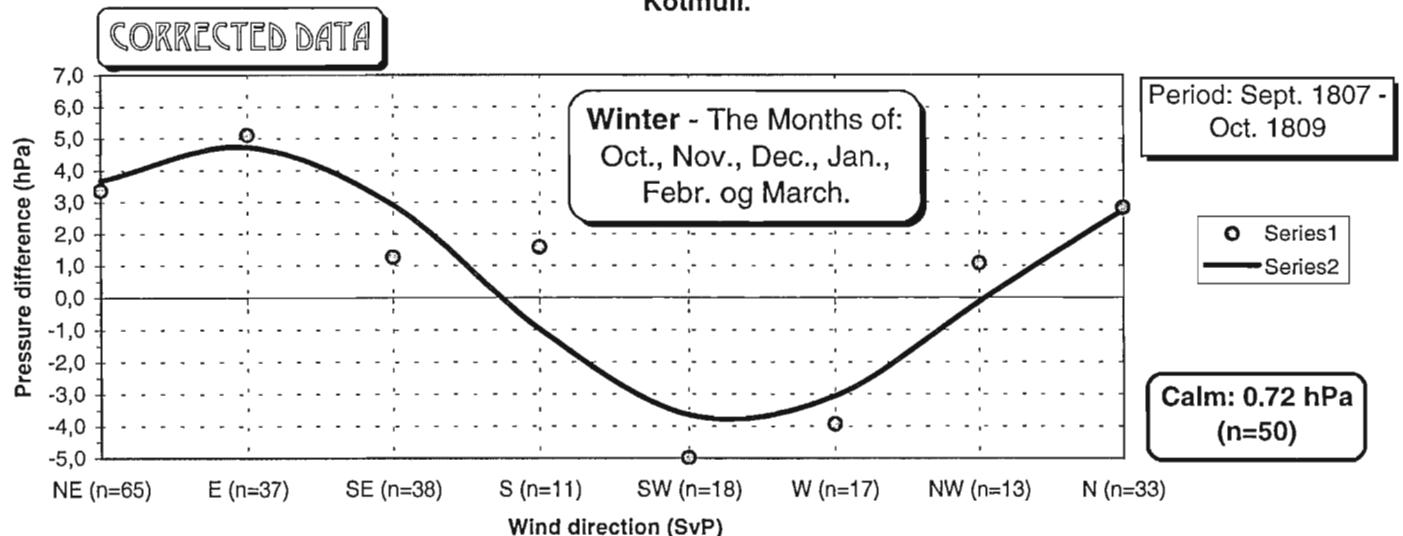

**Average pressure difference (V.Sch - SvP) grouped by month.**

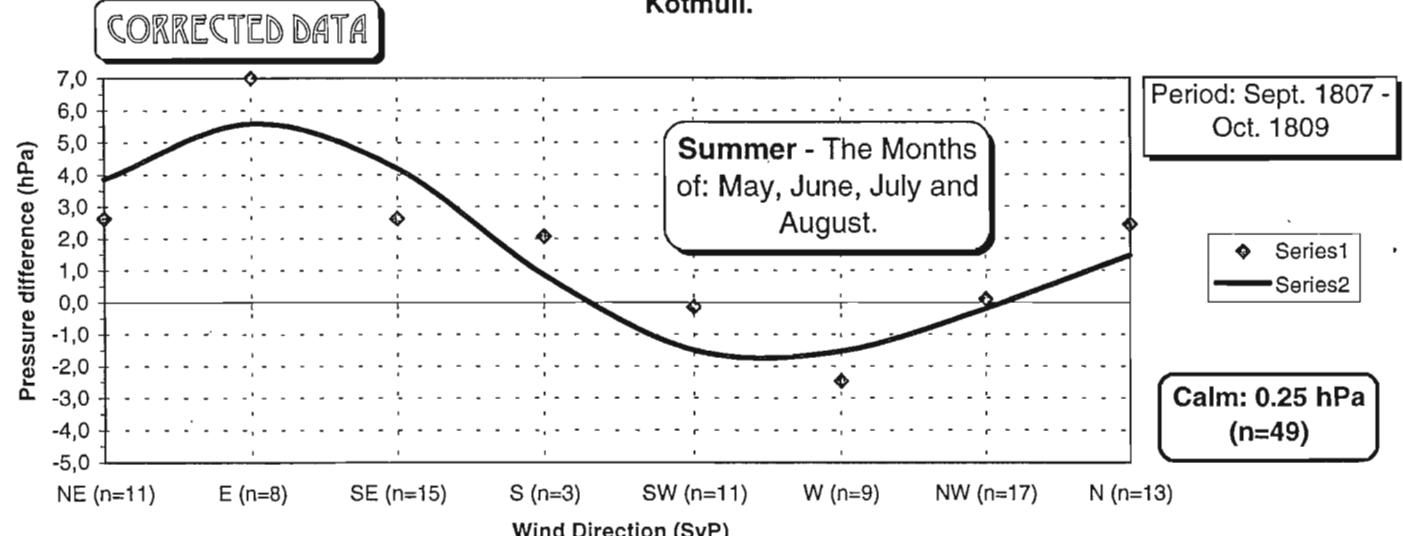

Average pressure difference (V.Sch - SvP) grouped by wind direction observations at  
Kotmúli.

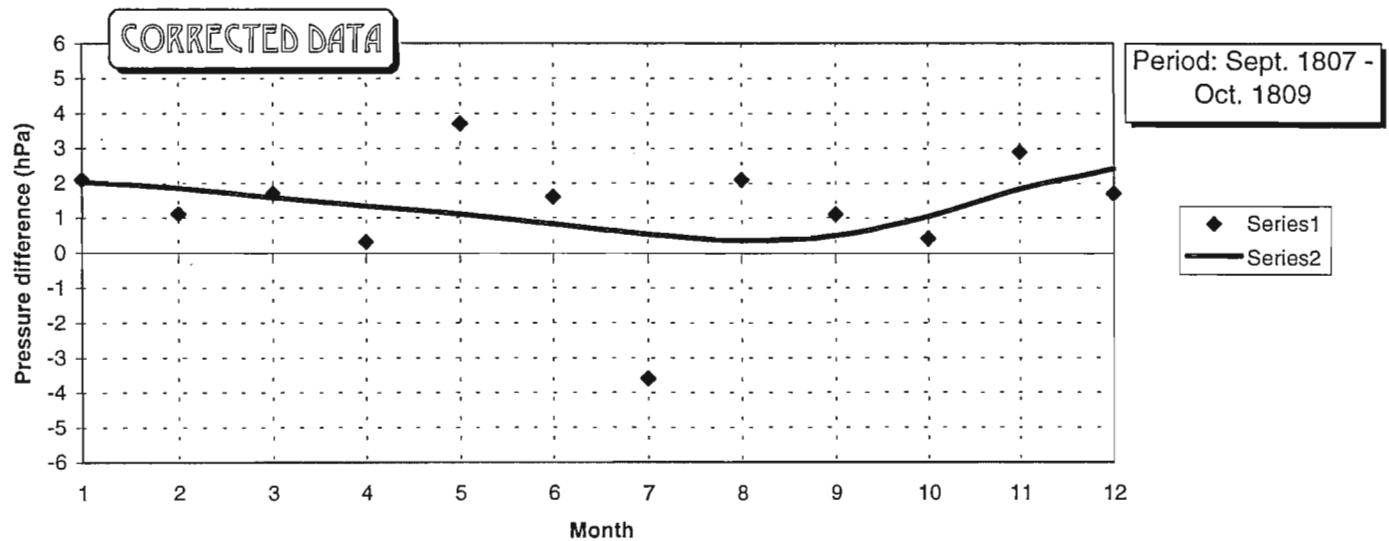

Average pressure difference (V.Sch - SvP) grouped by wind direction observations at  
Kotmúli.

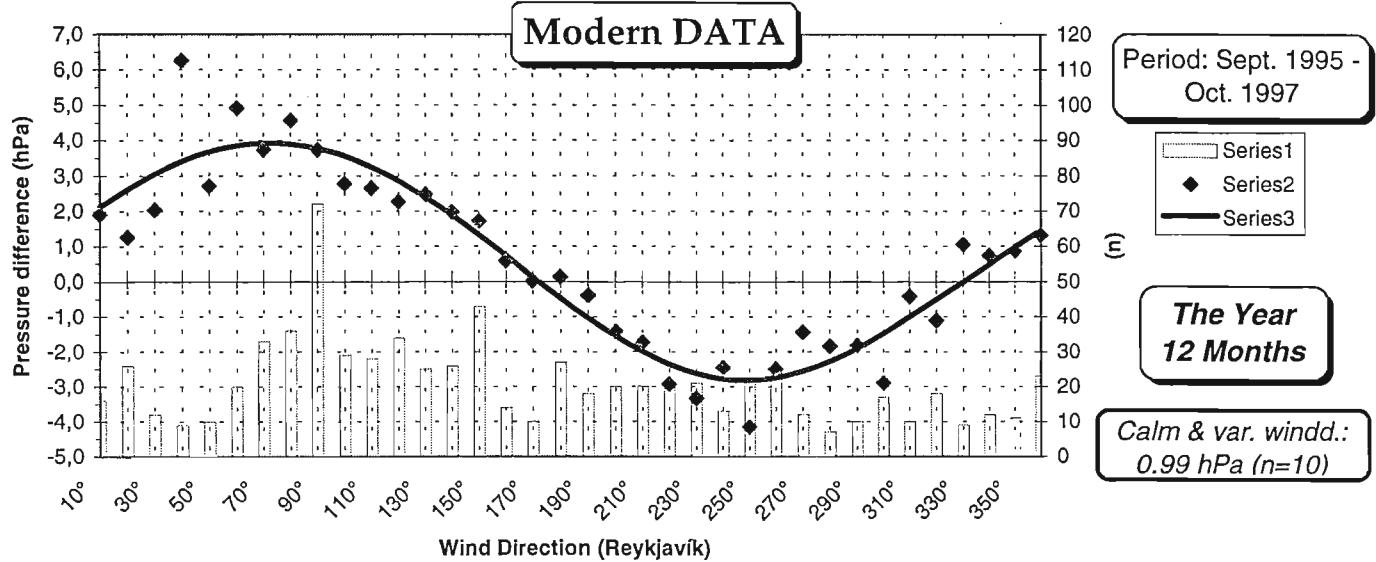

Average pressure difference (V.Sch - SvP) grouped by wind direction observations at  
Kotmúli.

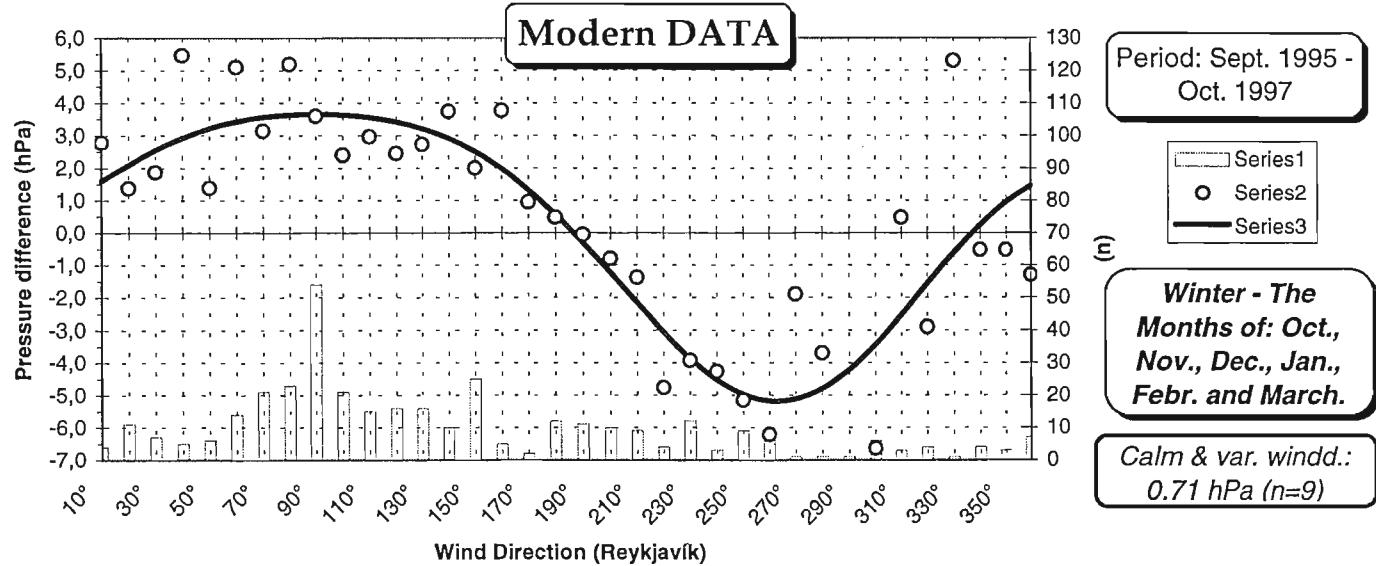

## Average pressure difference (V.Sch - SvP) grouped by month.

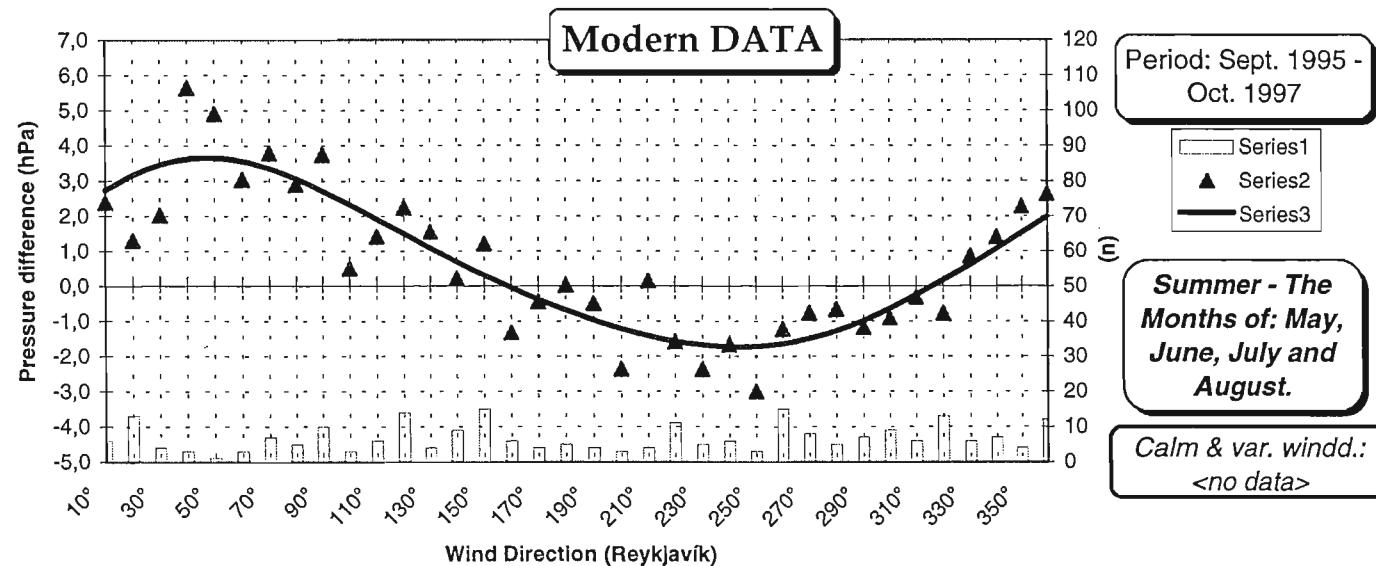

Average pressure difference (422-001) grouped by wind direction observations at Reykjavík.

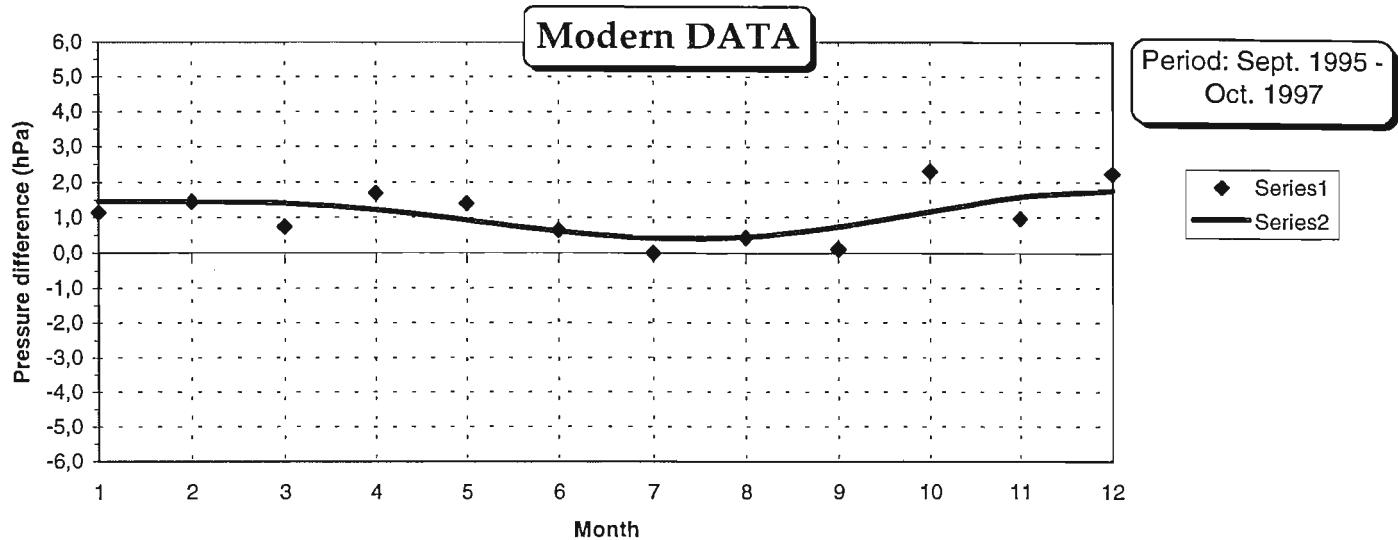

Average pressure difference (422-001) grouped by wind direction observations at Reykjavík.

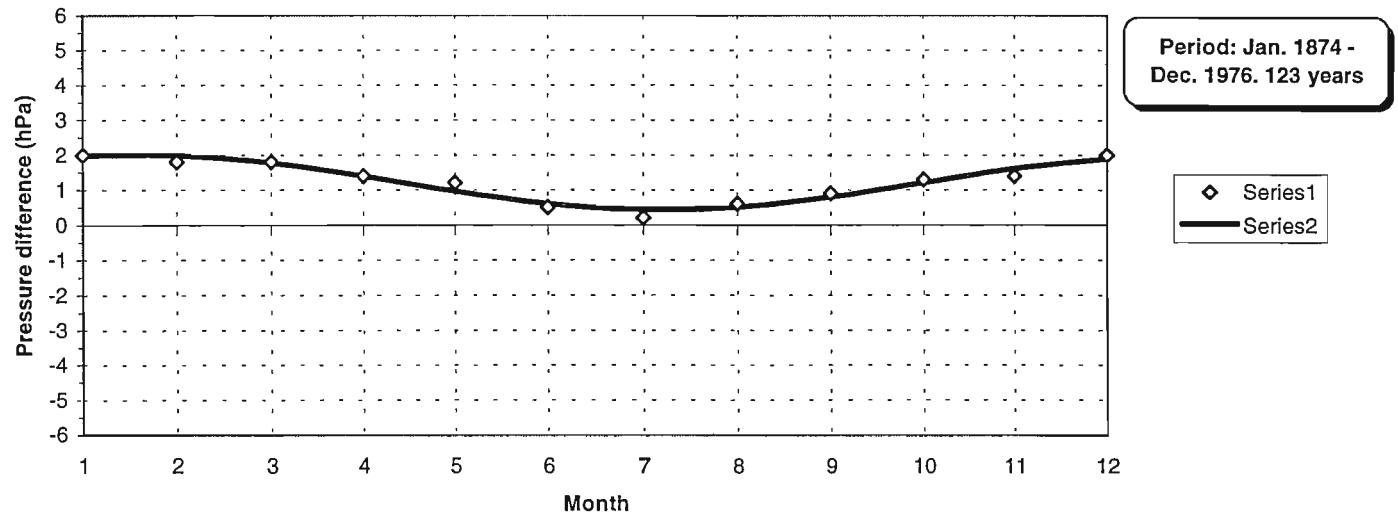

Average pressure difference (422-001) grouped by wind direction observations at Reykjavík.

Average pressure difference (422-001) grouped by month.

Average pressure difference in monthly averages (422 - sw coast series) grouped by month.

**A comparison of daily pressure values in two series: (Lievog [corr.] morn. obs. and Ketilsson [uncorr.]). Total number of observations: 1510**

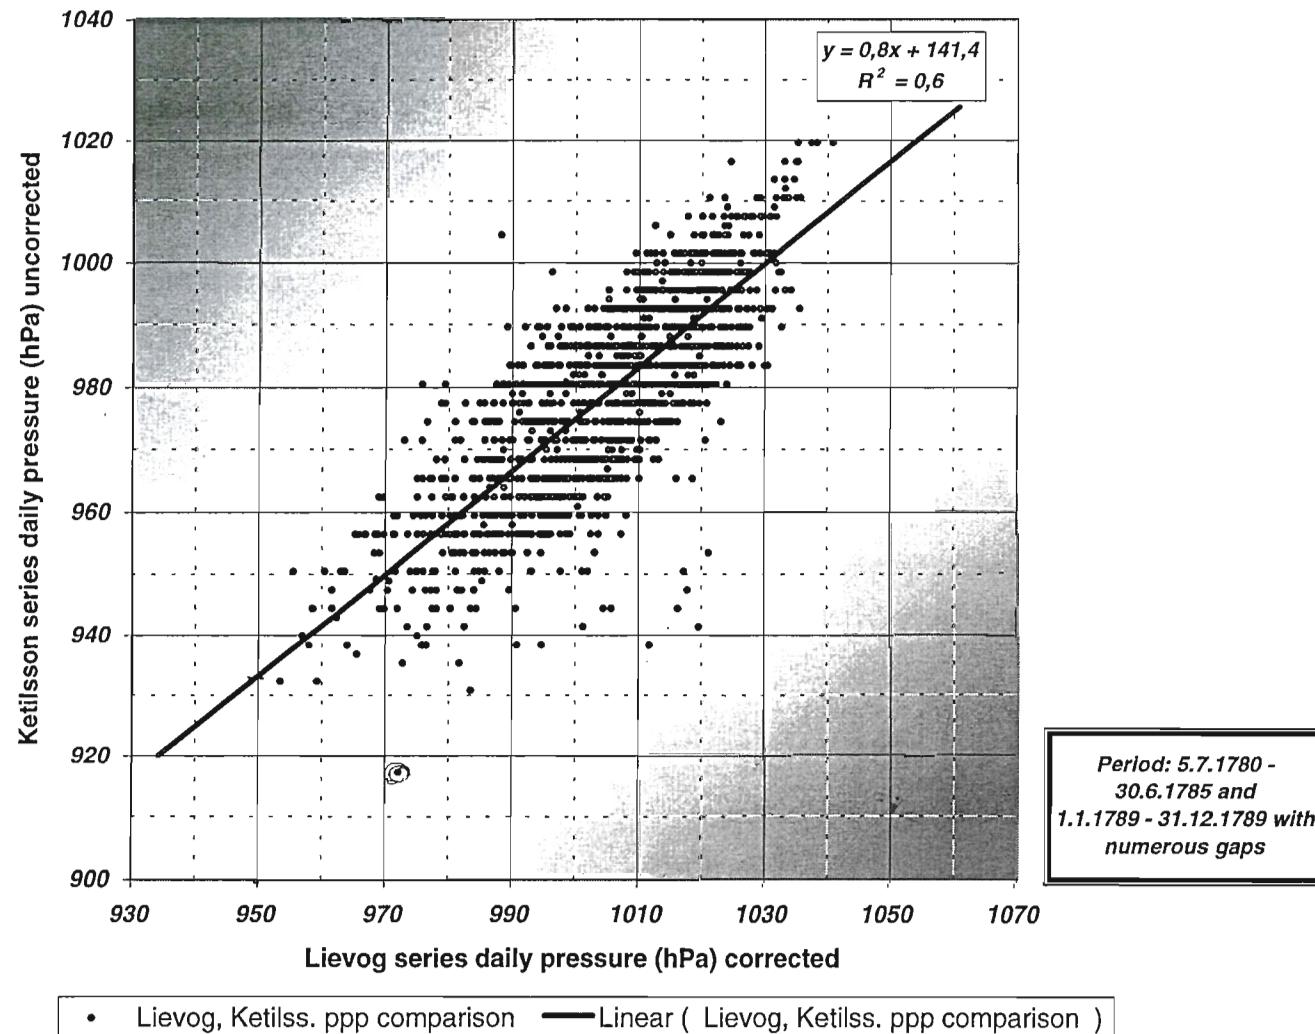

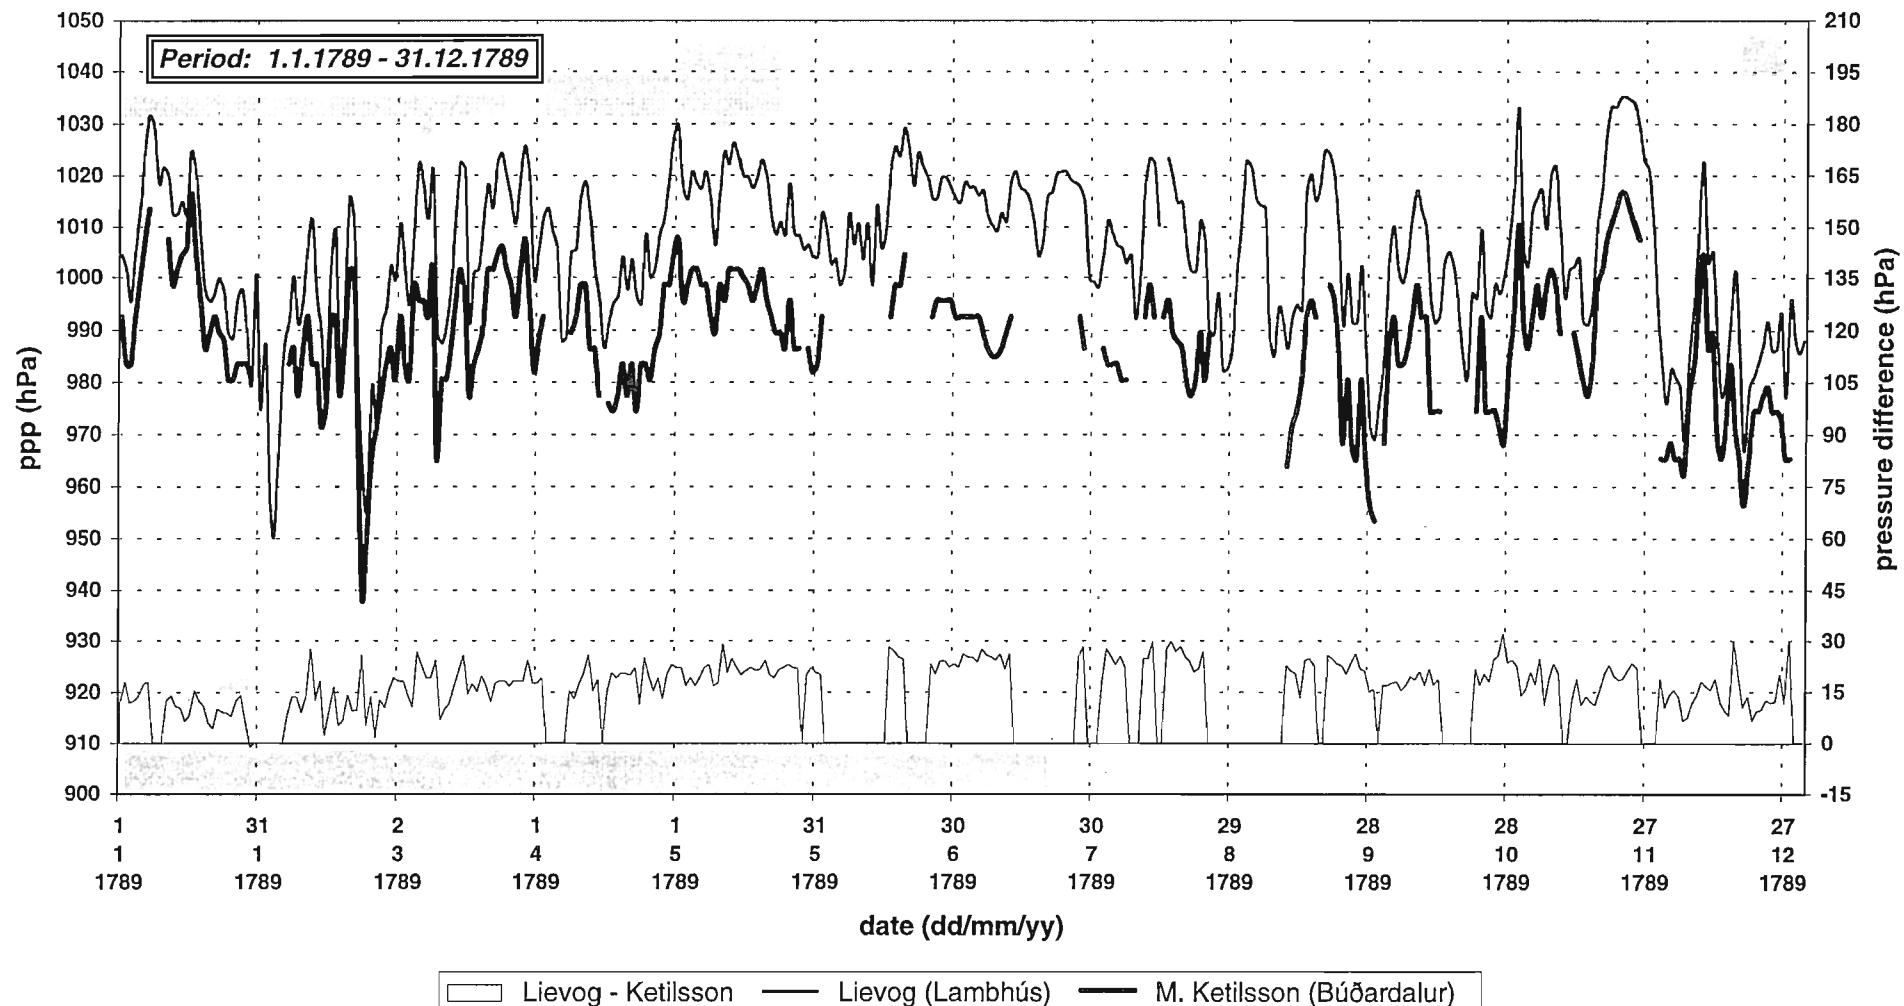

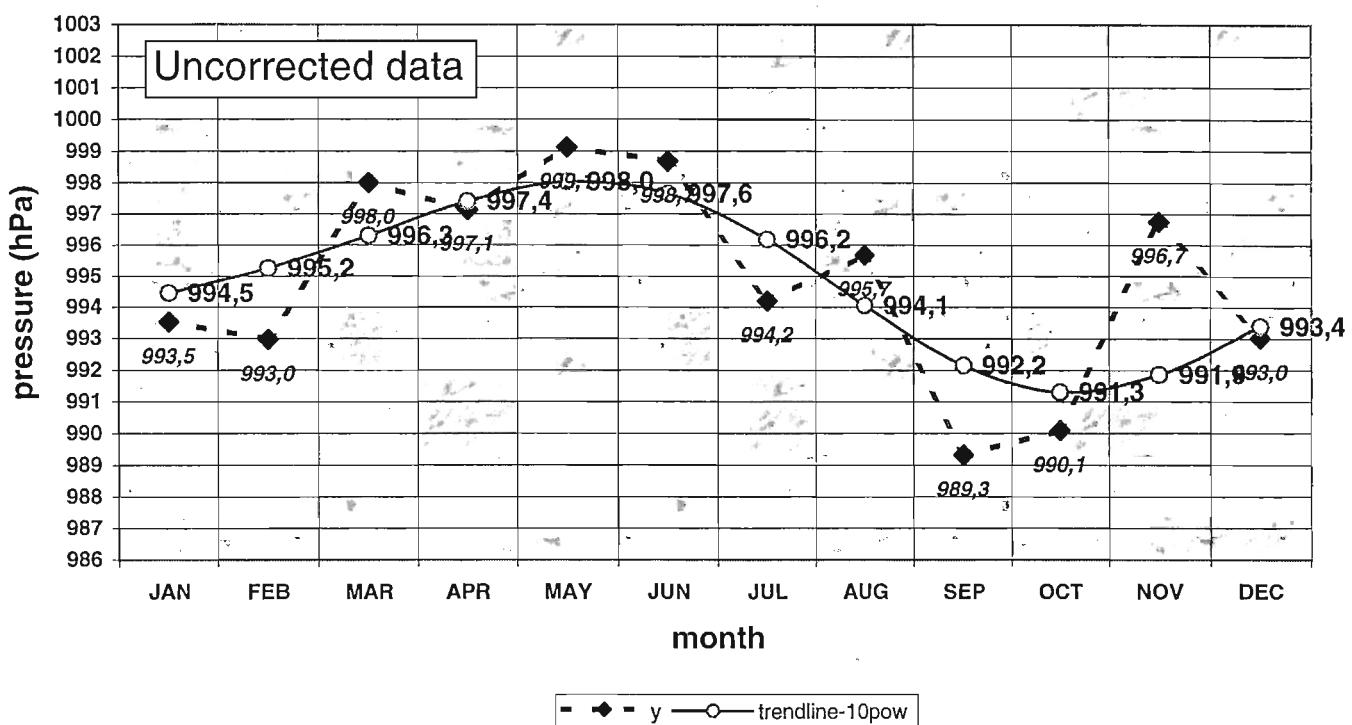

Chart 6

*Camparison of daily pressure values in Lievog ( corr. [morning obs.] ) and Ketilsson (uncorr.) series.*

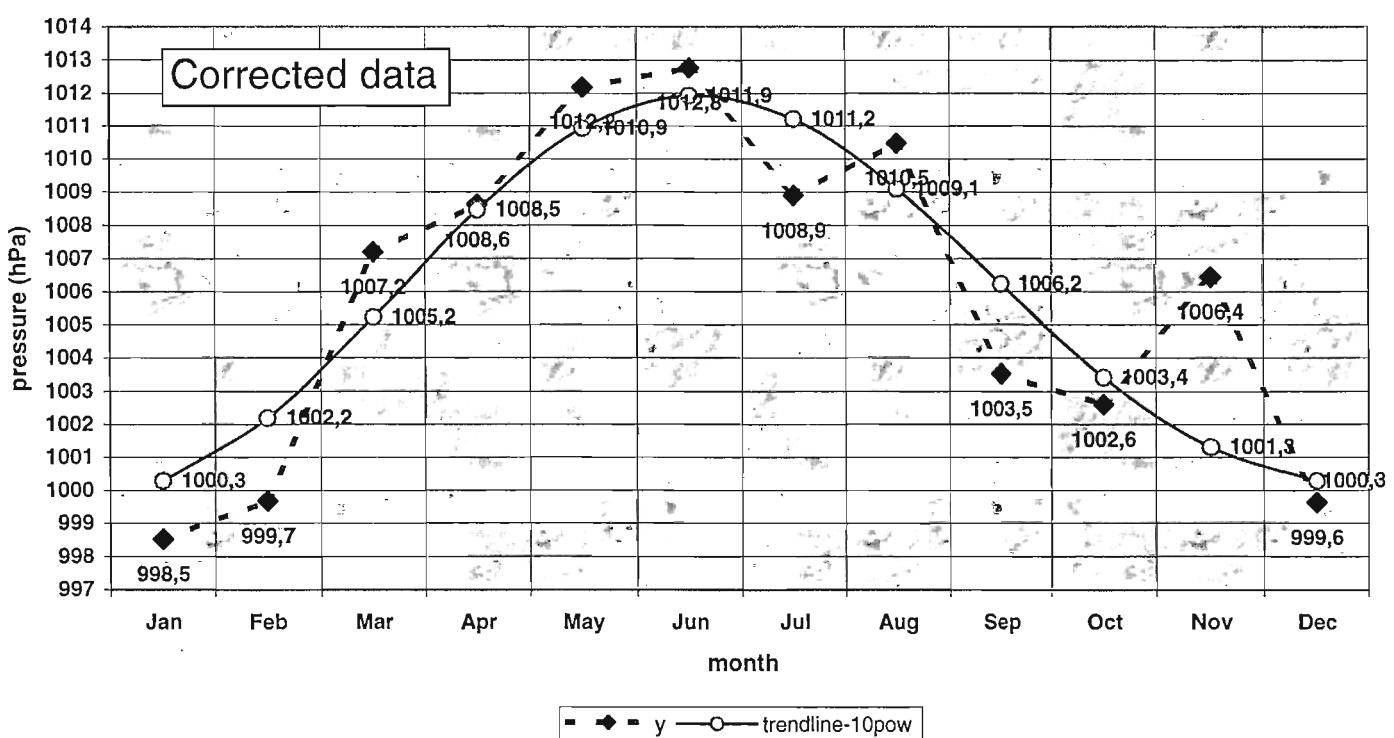

Charts 1

Lievog monthly means (ppp [EC] all observation times 1779-1789) with a 10. degr. polynomial fit

Lievog monthly means (ppp [C1] all observation times 1779-1789) with a 10. degr. polynomial fit

Charts 1

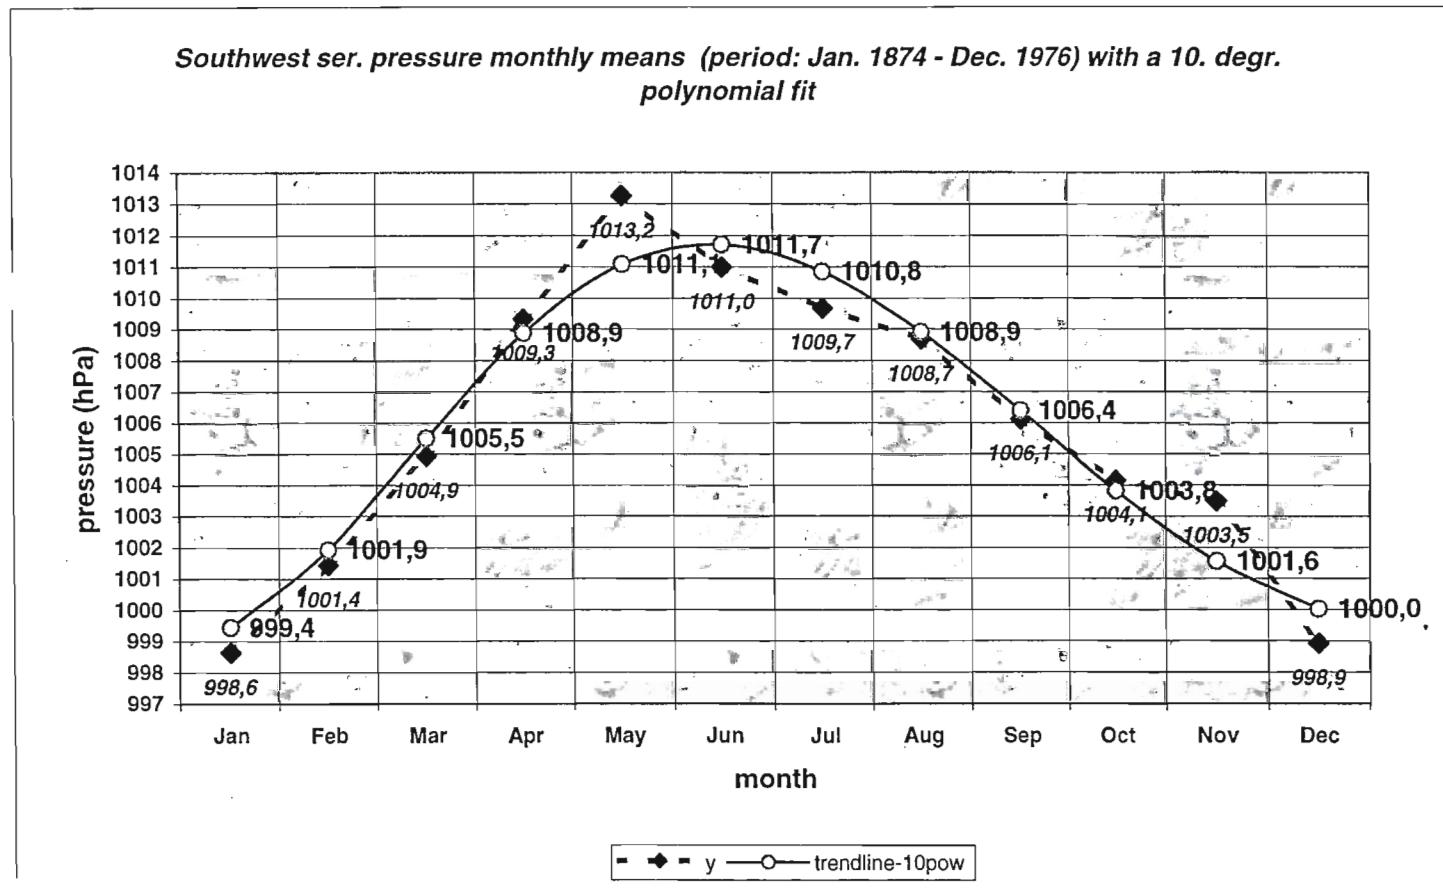

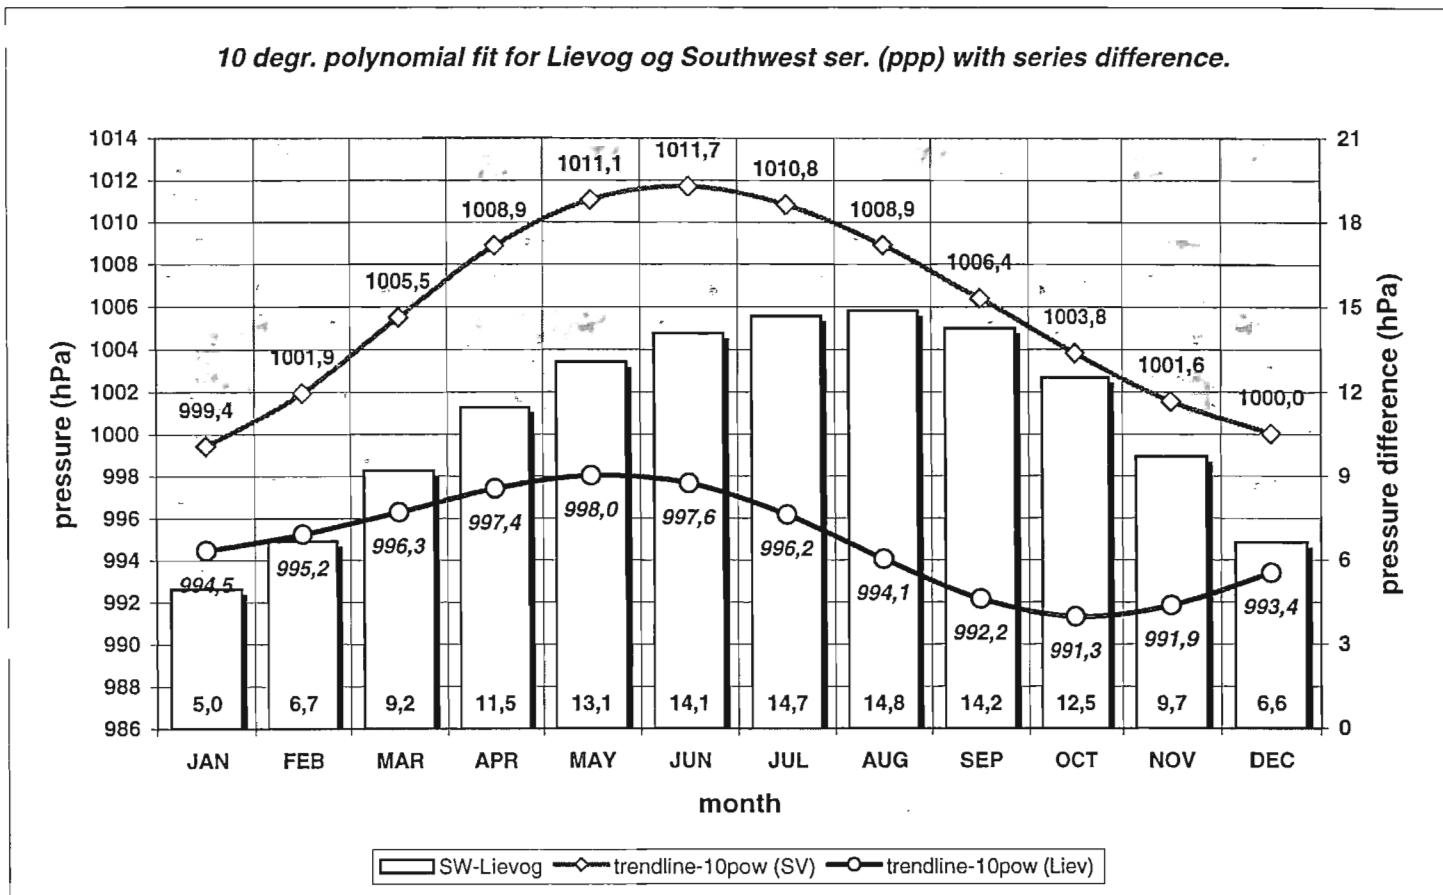

Chart1

## A comparison of monthly means (ppp [EC]) in Lievog series (1779-1789) and in Reykjavík (1961-1990)

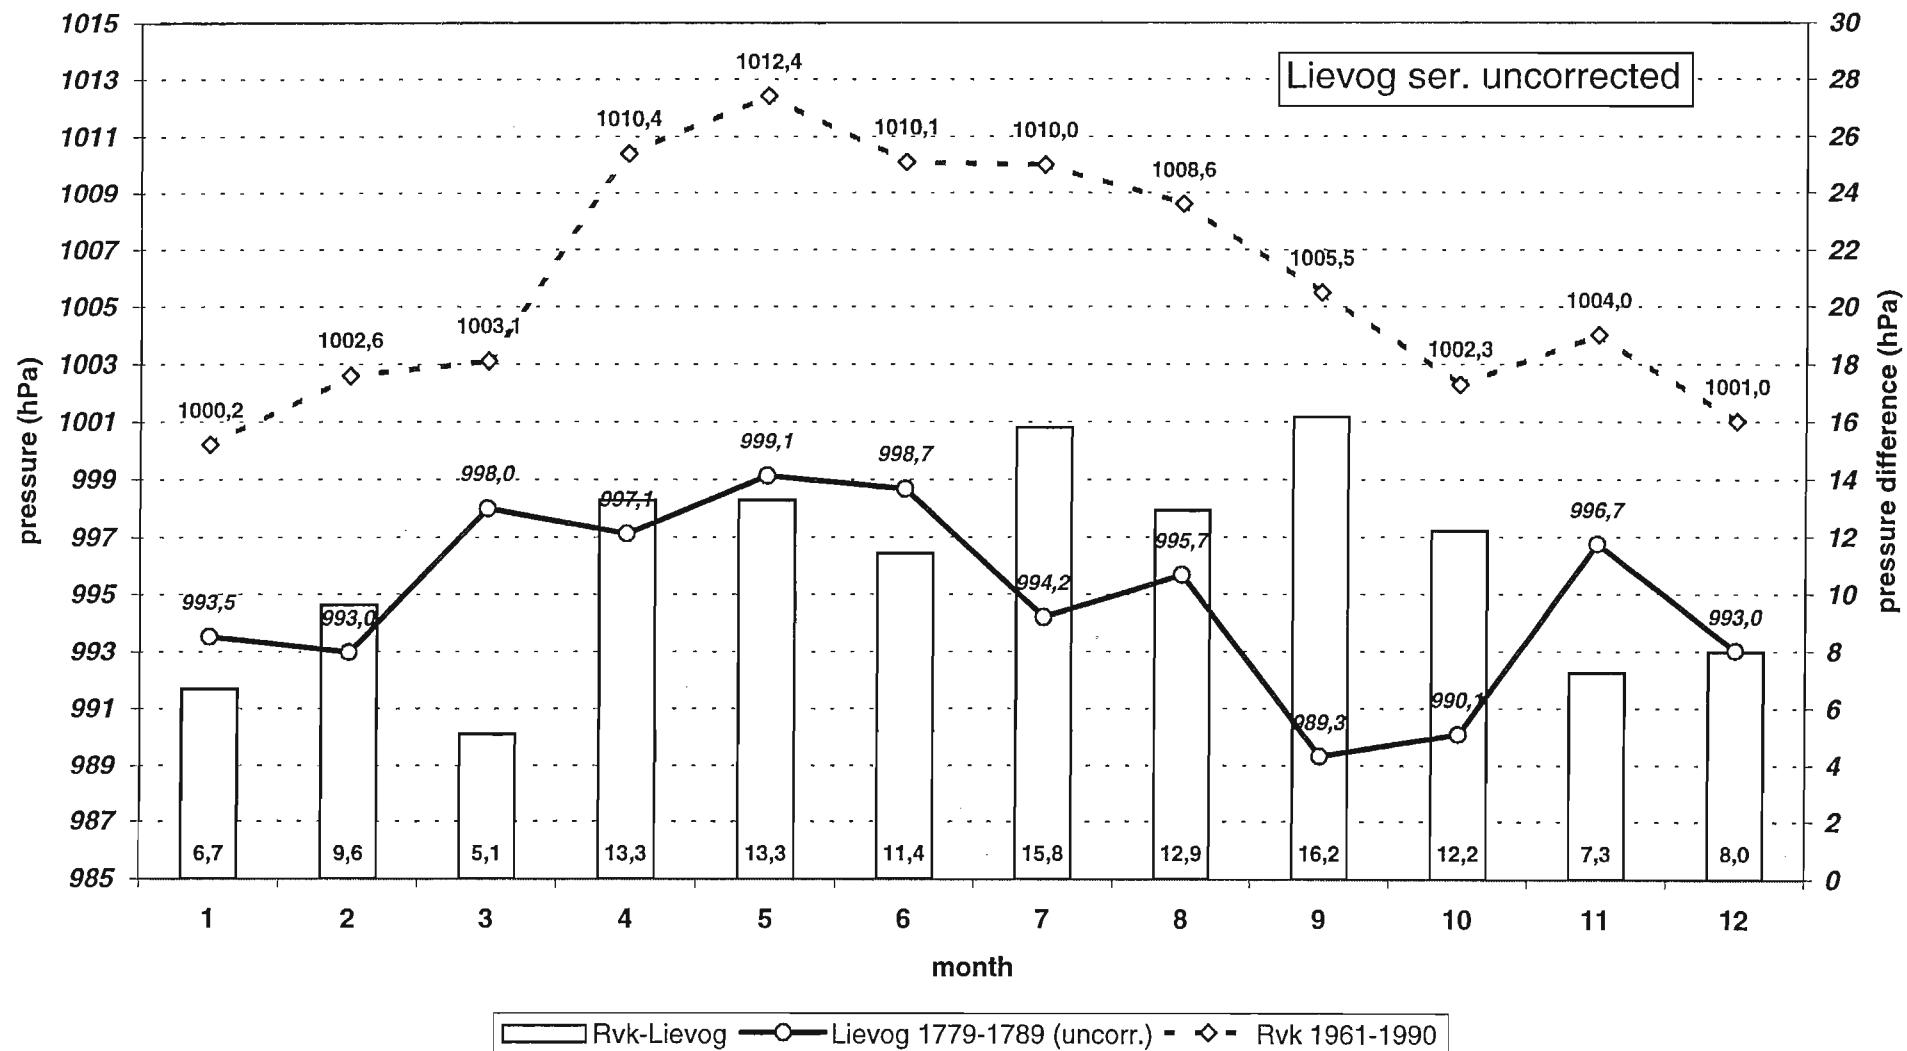

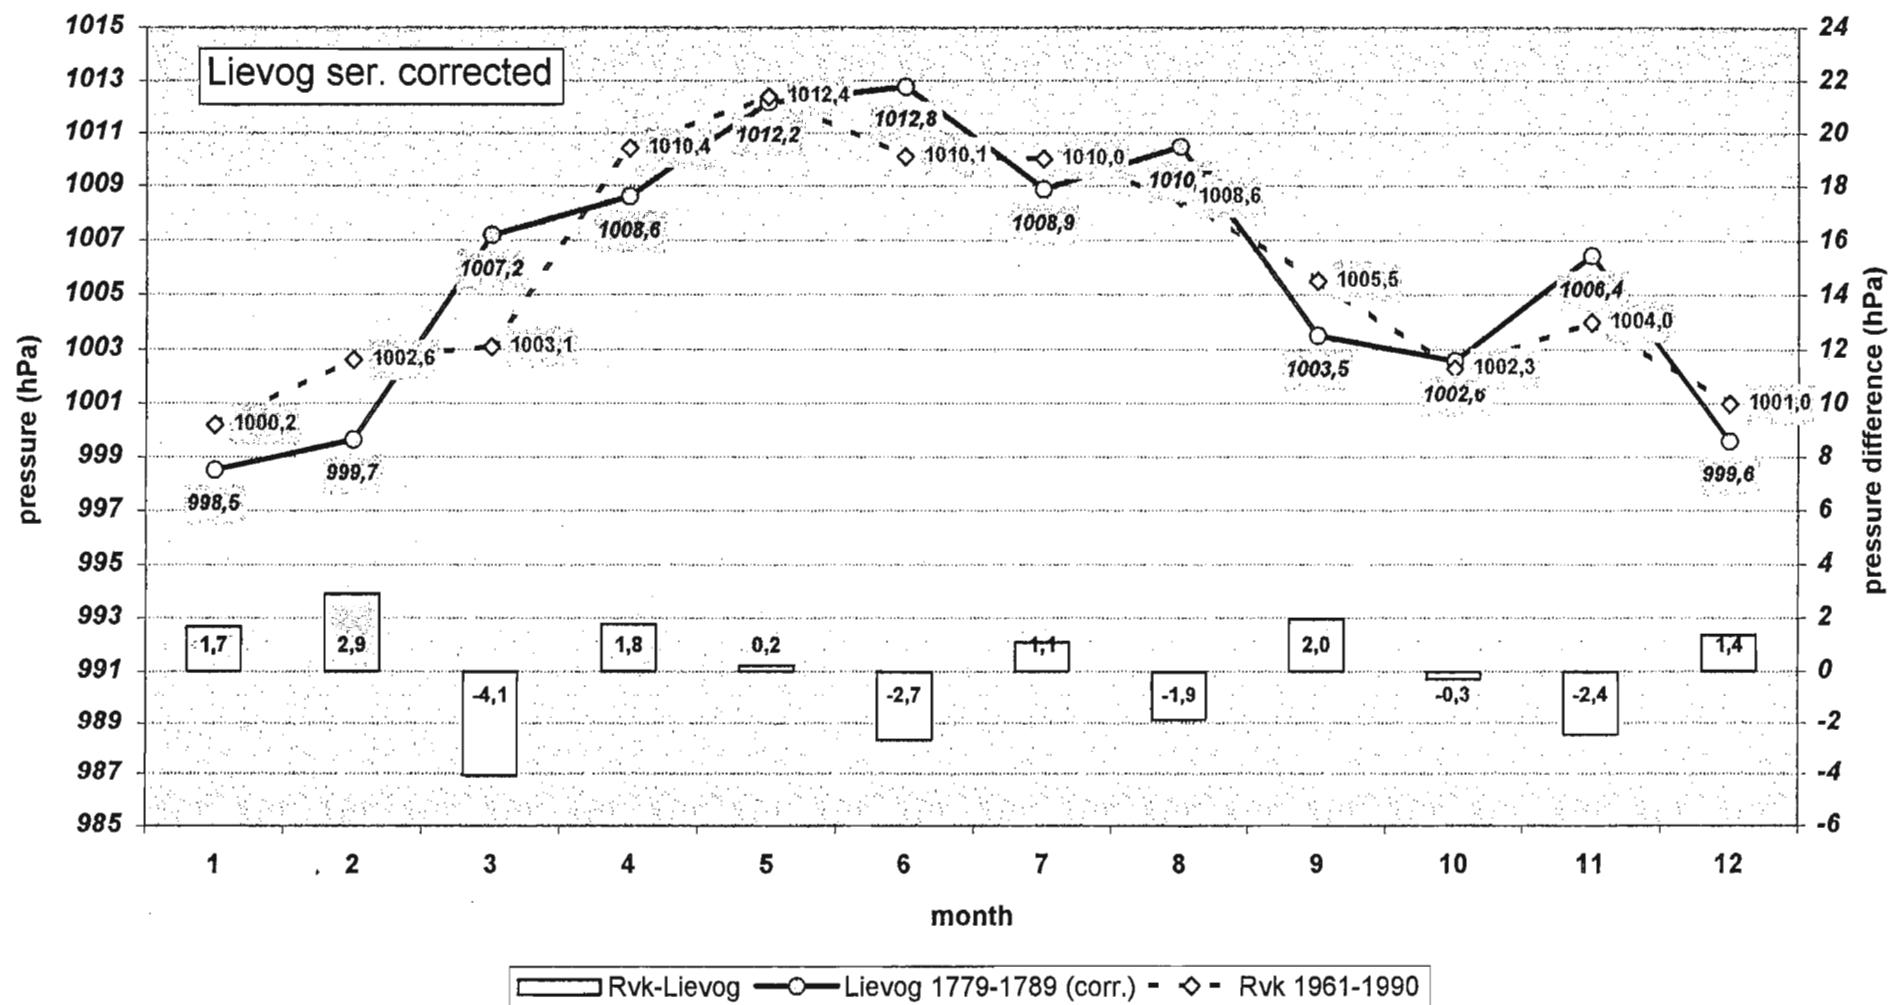

Chart5

**A comparison of monthly means (ppp [C1]) in Lievog series (1779-1789) and in Reykjavík (1961-1990)**

A comparison of 4 overlapping series: Lievog, Finnsson, Ketilsson and an unknown station. Period: 1.1.1779 - 31.12.1780. Lievog pressure series has been adjusted.

ppp: 3 day running average.
